

BlindCell

Empowering Messaging Security & Privacy

On iOS & Android Devices

BlindCell is an end-to-end encrypted messaging app offering a high level of security and privacy. Developed by [Experts for Integrated Solutions](#), it runs on iOS and Android mobile phones and smart devices.

BlindCell uses the Advanced Encryption Standard with 256-bit keys (AES-256) to encrypt/decrypt text messages. Its 256-bit key makes it practically unbreakable through brute-force attacks, even using the most powerful computers.

BlindCell can be used to:

- Share encrypted text messages through all social media and messaging apps, including WhatsApp, Viber, and Messenger.
- Send and receive encrypted text messages through public email services, including Gmail, Yahoo Mail, Hotmail, and Outlook, as well as private email accounts (e.g., [name@domain.com](#)).
- Exchange encrypted text messages through standard messaging apps on mobile phones & smart devices.
- Encrypt and store text messages locally on your mobile phone or smart device.

Why BlindCell?

- **Service Providers Can See Your Messages**
- **Messages Can Be Intercepted by Hackers**
- **Messages Can Be Monitored by Authorities**

Text messages are not end-to-end encrypted. Your service provider can access the contents of your messages and may store them on its systems for a certain period.
